

Recovered Resource Measurements

Horizon	Matched trajectories	Unbounded (min)	KEEPSAKE-B32 (min)
60 s	15	106.46	65.46
180 s	15	587.99	193.14

Table 1: Mean logged per-video elapsed times for the original fifteen output identities at each horizon (50 denoising steps). Hardware and software equivalence are not recorded in these logs; these are historical observations, not a controlled speedup benchmark. The timer is not retrieval-only latency.

Profile	Horizon	n	RGB (MiB)	RSS (GiB)	Alloc. (GiB)	Res. (GiB)
k -center B32	60 s	15	41.250	4.865	16.309	18.514
MCE B32	60 s	15	41.250	4.956	16.309	18.514
KEEPSAKE-B128	60 s	12	165.000	4.692	16.309	18.514
Unbounded (attention audit)	30 s	10	1176.914	4.330	15.987	18.320

Table 2: Separate historical profiles, all with CPU archives. Each memory entry is the maximum across completed runs: recorded logical RGB payload, sampled host RSS, and PyTorch rollout allocated/reserved peaks. These rows are not matched resource comparisons: horizons, budgets, cohorts and instrumentation differ, and hardware equivalence is unverified. Descriptor payload and container overhead are not included in RGB bytes.
